

Flynn's Classification Of Computer Architectures

Flynn Classification Of Computer architectures

SISD

- **SISD** (**S**inge-**I**nstruction stream, **S**inge-**D**ata stream)
- SISD corresponds to the traditional mono-processor (von Neumann computer). A single data stream is being processed by one instruction stream
- **OR**
- A single-processor computer (uni-processor) in which a single stream of instructions is generated from the program.

SIMD

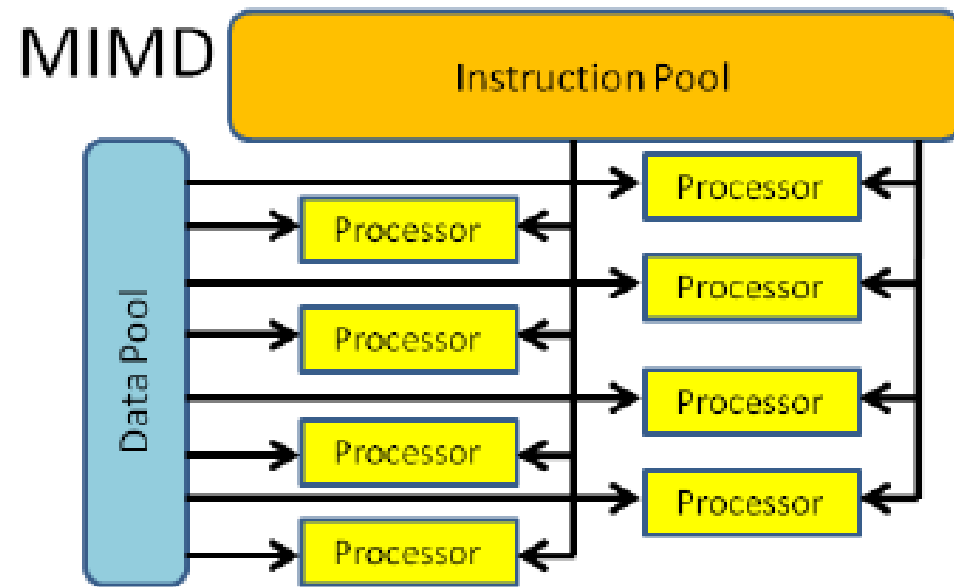

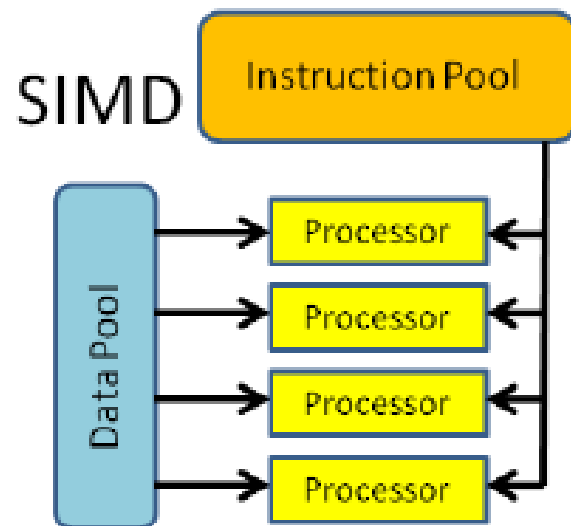

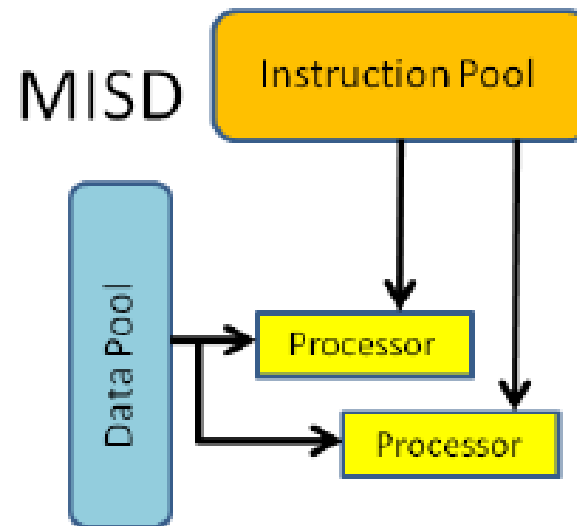

- **SIMD** (**S**ingle-Instruction stream, **M**ultiple-**D**ata streams)
- Each instruction is executed on a different set of data by different processors i.e multiple processing units of the same type process on multiple-data streams.
- This group is dedicated to array processing machines.
- Sometimes, vector processors can also be seen as a part of this group.

MISD

- **MISD** (**M**ultiple-Instruction streams, **S**inge-**D**ata stream)
- Each processor executes a different sequence of instructions.
- In case of MISD computers, multiple processing units operate on one single-data stream .
- In practice, this kind of organization has never been used

MIMD

- **MIMD** (**M**ultiple-Instruction streams, **M**ultiple-**D**ata streams)
- Each processor has a separate program.
- An instruction stream is generated from each program.
- Each instruction operates on different data.
- This last machine type builds the group for the traditional multiprocessors. Several processing units operate on multiple-data streams.
